

Prepared for: AnalystLab Africa, Data Analytics Internship

Project: Week 3 Task - Advanced Data Analysis

Role: Junior Business Intelligence Analyst

Tool: Microsoft Power BI

Dataset: Superstore Sales Dataset

Prepared by: Theresa Onyegiri

DAX MEASURES OR CALCULATED METRICS.

1. Distinctcount was used to count the total number of customers.
2. Distinctcount was used to count the total number of orders made.
3. Average function was used to calculate the average of sales.
4. Average function was used to calculate the average of discount.
5. Profit Margin = $\text{DIVIDE}([\text{Total Profit}], [\text{Total Sales}], 0)$
6. Total Profit = $\text{SUM}(\text{'Sample - Superstore'}[Profit])$
7. Total Sales = $\text{SUM}(\text{'Sample - Superstore'}[Sales])$
8. Date Table was created and connected the table in the data model using date.

DataTable =

VAR MinYear = YEAR(MIN('Sample - Superstore'[Order Date]))

VAR MaxYear = YEAR(MAX('Sample - Superstore'[Order Date]))

RETURN

ADDCOLUMNS (CALENDAR(DATE(MinYear, 1, 1), DATE(MaxYear, 12, 31)),

"Year", YEAR([Date]),

"Month No", MONTH([Date]),

"Month Name", FORMAT([Date], "MMM"),

"Year-Month", FORMAT([Date], "YYYY-MM"),

"Quarter", "Q" & FORMAT([Date], "Q"),

"Quarter-Year", "Q" & FORMAT([Date], "Q") & " " & YEAR([Date]))
